## Quick review of index and vector notation

 These two sets of equations are the same, we simply wrote them using different notations.

$$\nabla \cdot (\mathbf{u}) = 0$$
$$\frac{\partial \mathbf{u}}{\partial t} + \nabla \cdot (\mathbf{u}\mathbf{u}) = \frac{-\nabla p}{\rho} + \nu \nabla^2 \mathbf{u}$$

Vector notation

$$\frac{\partial u_i}{\partial x_i} = 0$$

$$\frac{\partial u_i}{\partial t} + \frac{\partial u_i u_j}{x_j} = -\frac{1}{\rho} \frac{\partial p}{\partial x_i} + \nu \frac{\partial^2 u_i}{\partial x_j x_j}$$

Index notation

- Let us illustrate index notation using operators that commonly appears in the governing equations of fluid dynamics.
- In our notation, the indices i, j, k can take the following values,

$$\left. \begin{array}{c} i \\ j \\ k \end{array} \right\} 1, 2, 3$$

• For example, the vectors  $x_i$  and  $u_j$ , and the second rank tensor  $u_iu_j$  are defined as follows,

$$x_{i} \begin{cases} x_{1} = x \\ x_{2} = y \\ x_{3} = z \end{cases} \qquad u_{j} \begin{cases} u_{1} = u \\ u_{2} = v \\ u_{3} = w \end{cases} \qquad u_{i}u_{j} = \begin{pmatrix} u_{1}u_{1} & u_{1}u_{2} & u_{1}u_{3} \\ u_{2}u_{1} & u_{2}u_{2} & u_{2}u_{3} \\ u_{3}u_{1} & u_{3}u_{2} & u_{3}u_{3} \end{pmatrix}$$

- One free index results in a vector.
- It represents a gradient.

$$\frac{\partial \phi}{\partial x_i} = \frac{\partial \phi}{\partial x_1} + \frac{\partial \phi}{\partial x_2} + \frac{\partial \phi}{\partial x_3}$$

$$\frac{\partial \phi}{\partial x_i} = \operatorname{grad} \phi = \nabla \phi$$

- The gradient will increase the rank of a tensor.
- That is, a zero-rank tensor (scalar), will become a first-rank tensor (vector), and a first-rank tensor will become a second-rank tensor (tensor).

- One repeated index results in a scalar.
- It is the sum over the index.

$$\frac{\partial u_i}{\partial x_i} = \frac{\partial u_1}{\partial x_1} + \frac{\partial u_2}{\partial x_2} + \frac{\partial u_3}{\partial x_3}$$

$$\frac{\partial u_i}{\partial x_i} = \operatorname{div} \mathbf{u} = \nabla \cdot \mathbf{u}$$

- The divergence will decrease the rank of a tensor.
- That is, a second-rank tensor (tensor), will become a first-rank tensor (vector), and a first-rank tensor will become a zero-rank (tensor).

Two free indices results in a tensor.

$$u_i u_j = \begin{pmatrix} u_1 u_1 & u_1 u_2 & u_1 u_3 \\ u_2 u_1 & u_2 u_2 & u_2 u_3 \\ u_3 u_1 & u_3 u_2 & u_3 u_3 \end{pmatrix} \rightarrow \mathbf{a} \otimes \mathbf{b} = \mathbf{a} \mathbf{b}^T = \mathbf{a} \mathbf{b}$$

$$\frac{\partial \phi_i}{\partial x_j} = \begin{pmatrix} \frac{\partial \phi_1}{\partial x_1} & \frac{\partial \phi_1}{\partial x_2} & \frac{\partial \phi_1}{\partial x_3} \\ \frac{\partial \phi_2}{\partial x_1} & \frac{\partial \phi_2}{\partial x_2} & \frac{\partial \phi_2}{\partial x_3} \\ \frac{\partial \phi_3}{\partial x_1} & \frac{\partial \phi_3}{\partial x_2} & \frac{\partial \phi_3}{\partial x_3} \end{pmatrix} \longrightarrow \nabla \phi$$

$$\frac{\partial \phi_j}{\partial x_i} = \begin{pmatrix} \frac{\partial \phi_1}{\partial x_1} & \frac{\partial \phi_2}{\partial x_1} & \frac{\partial \phi_3}{\partial x_1} \\ \frac{\partial \phi_1}{\partial x_2} & \frac{\partial \phi_2}{\partial x_2} & \frac{\partial \phi_3}{\partial x_2} \\ \frac{\partial \phi_1}{\partial x_2} & \frac{\partial \phi_2}{\partial x_2} & \frac{\partial \phi_3}{\partial x_2} \end{pmatrix} \longrightarrow \nabla \phi^T$$

Two free indices results in a tensor.

$$-\rho \overline{u_i' u_j'} = 2\mu_t S_{ij} - \frac{2}{3} k \delta_{ij} \qquad \delta_{ij} \left\{ \begin{array}{l} = 1 & \text{if } i = j \\ = 0 & \text{otherwise} \end{array} \right.$$

$$\delta_{ij} \left\{ \begin{array}{ll} = 1 & \text{if } i = j \\ = 0 & \text{otherwise} \end{array} \right.$$

 $S_{ij} = \frac{1}{2} \left( \frac{\partial u_i}{\partial x_i} + \frac{\partial u_j}{\partial x_i} \right)$ 

Kronecker delta

Strain rate tensor

$$\tau_{ij}^{R} = -\rho \overline{u_i' u_j'} = \begin{pmatrix} 2\mu S_{11} - \frac{2}{3}k & 2\mu S_{12} & 2\mu S_{13} \\ 2\mu S_{21} & 2\mu S_{22} - \frac{2}{3}k & 2\mu S_{23} \\ 2\mu S_{31} & 2\mu S_{32} & 2\mu S_{33} - \frac{2}{3}k \end{pmatrix}$$

In vector notation, is equivalent to,

$$-\rho\left(\overline{\mathbf{u}'\mathbf{u}'}\right) = 2\mu_T \bar{\mathbf{S}}^R - \frac{2}{3}\rho k\mathbf{I}$$

$$\mathbf{S} = \frac{1}{2} \left( \nabla \mathbf{u} + \nabla \mathbf{u}^T \right)$$

Strain rate tensor

- Two repeated indices (j) and one free indices (i) results in a tensor.
- Summation in *j* and it will form a vector in *i*.

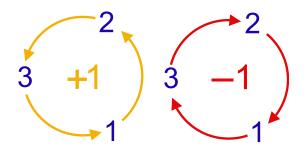

$$\frac{\partial (\overline{u_i u_j})}{\partial x_i} = \frac{\partial (\overline{u_i u_1})}{\partial x_1} + \frac{\partial (\overline{u_i u_2})}{\partial x_2} + \frac{\partial (\overline{u_i u_3})}{\partial x_3} \longrightarrow \text{Summation in } j$$

$$\begin{split} &\frac{\partial(\overline{u_iu_1})}{\partial x_1} + \frac{\partial(\overline{u_iu_2})}{\partial x_2} + \frac{\partial(\overline{u_iu_3})}{\partial x_3} = \\ &\left(\frac{\partial(\overline{u_1u_1})}{\partial x_1} + \frac{\partial(\overline{u_1u_2})}{\partial x_2} + \frac{\partial(\overline{u_1u_3})}{\partial x_3}\right)\vec{i} + \\ &\left(\frac{\partial(\overline{u_2u_1})}{\partial x_1} + \frac{\partial(\overline{u_2u_2})}{\partial x_2} + \frac{\partial(\overline{u_2u_3})}{\partial x_3}\right)\vec{j} + \\ &\left(\frac{\partial(\overline{u_3u_1})}{\partial x_1} + \frac{\partial(\overline{u_3u_2})}{\partial x_2} + \frac{\partial(\overline{u_3u_3})}{\partial x_3}\right)\vec{k} \end{split}$$

Permutation or Levi-Civita operator.

$$\varepsilon_{ijk}$$
  $\begin{cases} = 0 & \text{if any two of } i, j, k \text{ are the same} \\ = 1 & \text{for even permutation} \\ = -1 & \text{for odd permutation} \end{cases}$ 

for even permutation = 123, 312, 231for odd permutation = 321, 132, 213

Using the Levi-Civita operator in the following way,

$$\varepsilon_{ijk} \frac{\partial u_k}{\partial x_j}$$

Results in the following vector,

$$\varepsilon_{ijk} \frac{\partial u_k}{\partial x_j} = \underbrace{\varepsilon_{i11} \frac{\partial u_1}{\partial x_1}}_{j=1} + \underbrace{\varepsilon_{i12} \frac{\partial u_2}{\partial x_1}}_{j=1} + \underbrace{\varepsilon_{i13} \frac{\partial u_3}{\partial x_1}}_{j=1} + \dots$$

$$\underbrace{\varepsilon_{ijk} \frac{\partial u_k}{\partial x_j}}_{j=1} = \underbrace{\varepsilon_{ijk} \frac{\partial u_1}{\partial x_1}}_{j=1} + \underbrace{\varepsilon_{ijk} \frac{\partial u_2}{\partial x_1}}_{j=1} + \dots$$

$$\underbrace{\varepsilon_{ijk} \frac{\partial u_1}{\partial x_2}}_{j=1} + \underbrace{\varepsilon_{ijk} \frac{\partial u_2}{\partial x_2}}_{j=2} + \underbrace{\varepsilon_{ijk} \frac{\partial u_3}{\partial x_2}}_{j=2} + \dots$$

$$\underbrace{\varepsilon_{ijk} \frac{\partial u_1}{\partial x_1}}_{j=1} + \underbrace{\varepsilon_{ijk} \frac{\partial u_2}{\partial x_2}}_{j=2} + \underbrace{\varepsilon_{ijk} \frac{\partial u_3}{\partial x_2}}_{j=2} + \dots$$

$$\underbrace{\varepsilon_{ijk} \frac{\partial u_1}{\partial x_1}}_{j=1} + \underbrace{\varepsilon_{ijk} \frac{\partial u_2}{\partial x_2}}_{j=2} + \underbrace{\varepsilon_{ijk} \frac{\partial u_3}{\partial x_2}}_{j=2} + \dots$$

$$\underbrace{\varepsilon_{ijk} \frac{\partial u_1}{\partial x_1}}_{j=1} + \underbrace{\varepsilon_{ijk} \frac{\partial u_2}{\partial x_2}}_{j=2} + \underbrace{\varepsilon_{ijk} \frac{\partial u_3}{\partial x_2}}_{j=2} + \dots$$

$$\underbrace{\varepsilon_{ijk} \frac{\partial u_1}{\partial x_2}}_{j=1} + \underbrace{\varepsilon_{ijk} \frac{\partial u_2}{\partial x_2}}_{j=2} + \underbrace{\varepsilon_{ijk} \frac{\partial u_3}{\partial x_3}}_{j=3} + \dots$$

$$\underbrace{\varepsilon_{ijk} \frac{\partial u_1}{\partial x_2}}_{j=2} + \underbrace{\varepsilon_{ijk} \frac{\partial u_2}{\partial x_2}}_{j=2} + \underbrace{\varepsilon_{ijk} \frac{\partial u_3}{\partial x_3}}_{j=3} + \dots$$

$$\underbrace{\varepsilon_{ijk} \frac{\partial u_1}{\partial x_2}}_{j=2} + \underbrace{\varepsilon_{ijk} \frac{\partial u_2}{\partial x_3}}_{j=3} + \underbrace{\varepsilon_{ijk} \frac{\partial u_3}{\partial x_3}}_{j=3} + \underbrace{\varepsilon_{ijk} \frac{\partial u_3}{\partial x_3}}_{j=3} + \dots$$

$$\underbrace{\varepsilon_{ijk} \frac{\partial u_1}{\partial x_2}}_{j=2} + \underbrace{\varepsilon_{ijk} \frac{\partial u_2}{\partial x_3}}_{j=3} + \underbrace{\varepsilon_{ijk} \frac{\partial u_3}{\partial x$$

Using the Levi-Civita operator in the following way,

$$\varepsilon_{ijk} \frac{\partial u_k}{\partial x_j}$$

And after some algebra, we obtain the following vector,

$$\varepsilon_{ijk} \frac{\partial u_k}{\partial x_j} = \left(\frac{\partial u_3}{\partial x_2} - \frac{\partial u_2}{\partial x_3}\right) \vec{i} + \left(\frac{\partial u_1}{\partial x_3} - \frac{\partial u_3}{\partial x_1}\right) \vec{j} + \left(\frac{\partial u_2}{\partial x_1} - \frac{\partial u_1}{\partial x_2}\right) \vec{k}$$

$$\operatorname{curl} \mathbf{u} = \nabla \times \mathbf{u}$$

- A few additional operators in index notation that you will find in the governing equations of fluid dynamics.
  - Strain rate tensor,

$$S_{ij} = \frac{1}{2} \left( \frac{\partial u_i}{\partial x_j} + \frac{\partial u_j}{\partial x_i} \right)$$

$$\mathbf{S} = \frac{1}{2} \left( \nabla \mathbf{u} + \nabla \mathbf{u}^T \right)$$

- A few additional operators in index notation that you will find in the governing equations of fluid dynamics.
  - Laplacian,

$$\frac{\partial^2 u_i}{\partial x_j^2} = \frac{\partial}{\partial x_j} \left( \frac{\partial u_i}{\partial x_j} \right) = \begin{bmatrix} \frac{\partial^2 u_1}{\partial x_1^2} & \frac{\partial^2 u_1}{\partial x_2^2} & \frac{\partial^2 u_1}{\partial x_3^2} \\ \frac{\partial^2 u_2}{\partial x_1^2} & \frac{\partial^2 u_2}{\partial x_2^2} & \frac{\partial^2 u_2}{\partial x_3^2} \\ \frac{\partial^2 u_3}{\partial x_1^2} & \frac{\partial^2 u_3}{\partial x_2^2} & \frac{\partial^2 u_3}{\partial x_3^2} \end{bmatrix}$$

$$\nabla \cdot \nabla \mathbf{u} = \nabla^2 \mathbf{u} = \Delta \mathbf{u}$$

The Laplacian operator will not change the rank of a tensor.

- A few additional operators in index notation that you will find in the governing equations of fluid dynamics.
  - Every second-rank tensor, *e.g.*, the gradient of a vector, can be decomposed into a symmetric part and an anti-symmetric part.

$$\frac{\partial u_i}{\partial x_j} = \underbrace{\frac{1}{2} \left( \frac{\partial u_i}{\partial x_j} + \frac{\partial u_j}{\partial x_i} \right)}_{\text{Symmetric part}} + \underbrace{\frac{1}{2} \left( \frac{\partial u_i}{\partial x_j} - \frac{\partial u_j}{\partial x_i} \right)}_{\text{Anti-symmetric part}}$$

$$\nabla \mathbf{u} = \underbrace{\frac{1}{2} \left( \nabla \mathbf{u} + \nabla \mathbf{u}^T \right)}_{\text{Symmetric part}} + \underbrace{\frac{1}{2} \left( \nabla \mathbf{u} - \nabla \mathbf{u}^T \right)}_{\text{Anti-symmetric part}}$$

 The symmetric part is equivalent to the strain rate tensor and the antisymmetric part is equivalent to the spin tensor (vorticity).
